

# Silk Performance Explorer

Report generated at: Sunday, November 23, 2014 - 9:58:10 PM

## Overview Report

Click [here](#) to edit text.[general information](#)   [summary tables](#)   [ranking](#)   [user types](#)   [custom charts](#)   [custom tables](#)   [detailed charts](#)

Project: CCProject   Default Project  
Load test: 0   None  
Start date/time: 11/20/2014 12:36:52 AM  
Duration of simulation: 01:28:30  
Agents: 4  
Users: 10

[Report Description:](#)

### General Project Settings

Application type: Web business transaction (HTML/HTTP)  
Workload: Workload1  
Workload model: Dynamic

**Active Users**

This chart shows the overall number of active virtual users. A virtual user is considered as active if the user has started and is currently in one of the following states: executing, wait DB, document downloading, and thinktime.

Click [here](#) to edit text.

number of concurrent users: 5

**Transactions**

The number of Silk Performer transactions per second.  
Click [here](#) to edit text.

number of transactions: 202

average number of transactions/sec: 0.04

**Errors**

This chart shows the number of API errors per second, including Internet, database, and middleware APIs. A problem is considered an error if its severity is defined as "error" or worse, that is, of higher severity ("transaction exit" or "process exit"). A problem is ignored if its severity is defined as "informational" or "warning".

Click [here](#) to edit text.

number of errors: 0

## Throughput / Concurrency

Throughput[kB]

The amount of data sent to and received from the server; this includes header and body content information, all TCP/IP-related traffic (HTTP, native TCP/IP, IIOP, POP3, SMTP, FTP, LDAP and WAP), and secure traffic over SSL/TLS. This measurement does not include data overhead caused by SSL/TLS encryption and WTLS encryption in case of WAP.

[Request data sent](#)

[Response data received](#)

Click [here](#) to edit text.

throughput[kB]: 722,963

average throughput[kB]/sec: 136.15

Http Hits

The number of HTTP requests that arrive at the Web server.  
Click [here](#) to edit text.

number of hits: 11,482

average number of hits/sec: 2.16

## Response Times - Transactions

Trans. (busy) ok[s]

The response time of successful transactions, excluding the think times within those transactions. A transaction response time is reported in this type of measurement if all API function calls within the transaction succeed.

Click [here](#) to edit text.

minimum[s]: 2.81

average[s]: 8.47

maximum[s]: 15.29

standard deviation[s]: 3.82

## Response Times - Page and Action Timers

Page time[s]

The time it takes a virtual user to download a Web page from the server, in seconds. Response times for Web pages are subdivided into server-busy times, document-downloading times, and round-trip times.

Click [here](#) to edit text.

average page time[s]: 0.71

[average document downloading time\[s\]: 0.23](#)

[average server busy time\[s\]: 0.00](#)

[back to overview](#)

[general information](#)[summary tables](#)[ranking](#)[user types](#)[custom charts](#)[custom tables](#)[detailed charts](#)

The Summary tables contain summarized measurements on a global level. They contain measurement types that aggregate individual measurements from other measurement groups as well as measurement types that represent information on a global level that is not included in other measurement groups.

[back to overview](#)

[general information](#)   [summary tables](#)   [ranking](#)   [user types](#)   [custom charts](#)   [custom tables](#)   [detailed charts](#)

The user type section provides detailed tabular results about transactions, individual timers and counters, and interface dependent timers and counters for WEB, database, IIOP and Tuxedo on a per user type level. In addition all API errors, and warnings for each user type are listed. Click [here](#) to edit text.

User Type	Average Page Time [s]	Average Action Time [s]	#Transaction OK	#Transaction Cancelled	#Transaction Failed	#Errors
 CCTryScript.bdf/VUser-Profile1	0.707	0.000	197			--

#### Time bound histograms

Bound1	75.15% < 1	In this histogram, response time measurements are grouped into three categories: Green: The percentage of response times shorter than the value for time bound 1.
Bound2	93.88% < 2	Yellow: The percentage of response times longer than the value for time bound 1, but shorter than the value for time bound 2. Red: The percentage of response times longer than the value for time bound 2.

In the example above,

75% of the response times are shorter than time bound 1, these response times may be considered fully satisfactory;

19% of the response times are between time bound 1 and time bound 2, these response times may be considered slightly problematic, but still acceptable;

6% of the response times are longer than time bound 2, these response times have to be considered seriously problematic.

You can set the time bounds for transactions, custom timers, and page timers automatically using the baseline results of your test. From the Silk Performer workflow bar, select Confirm Baseline/Set response time thresholds. MeasureSetBound functions will be generated into your script to set thresholds for the selected timers. Additionally, you can set time bounds manually in your test script by calling the MeasureSetBound function.

#### Response time breakdown histograms

average page time[s]	3.30	In this histogram, response times for Web pages are subdivided into server-busy times, document-downloading times, and round-trip times. Response times for Web forms are subdivided into server-busy times and round-trip times.
average document download time[s]	2.77	In the example, the histogram illustrates that the server busy time (medium blue) makes up 36% (1.21/3.30) of the overall Web page response time. The document downloading-time (medium blue + light blue) makes up 84% (2.77/3.30) of the overall response time (medium blue + light blue + dark blue).
average server busy time[s]	1.21	

#### Percentile Charts

Percentile graphs enable you to analyze the percentages of actions that execute within certain time limits. With the help of percentile graphs you can determine the percentage of transactions, page-load times, and custom timers that meet the performance criteria defined for your system. Additionally, by considering the shape of a graph, you can analyze the distribution of execution times.

The X-axis represents the percentage of the total number of actions (transaction executions, web-page downloads, or custom timings) that are measured during a load test. The Y-axis represents the time required to perform the actions.

In this example, 90 percent of the pages could be downloaded within 6.7 seconds, and 70 percent had a download time below 5.65 seconds. Also, there was no page which could be downloaded below 3.15 seconds. By analyzing the shape of the graph, you could derive that further load on the server will increase download times exponentially.

**CCTryScript.bdf/VUser-Profile1**  
**(CCTryScript.bdf (C:\Users\Sudeep\Desktop\))**

user types

## User type project settings

Stress test:	false
Random think times:	true
Random transaction order:	false
TrueLog on error:	false
Pacing:	no pacing
Modem simulation:	false
Client IP address multiplexing:	false
Browser:	MS Internet Explorer 8.0
Connect through proxy:	false
Simulation user behaviour for each transaction:	true
User behavior:	first time user
Document cache:	true      Check:      once per Session
Emulate DNS lookup:	false

## Transactions

The transactions measurement group contains response time information about transactions. For each transaction defined in your load test script, a group of measurements is created; the name of the transaction is used as the key for the measurements. The histogram enables you to easily check whether or not the transactions response times meet the response time requirements. Click [here](#) to edit text.

-------------	---------------

#### Page and Action timers

The page timer measurements group contains measurements related to Web pages that are downloaded by a virtual user. For each Web page that is downloaded, a measurement group is created; the title of the Web page is used as the key to the measurement group created. Click [here](#) to edit text.

## Web forms

The Web form measurement group contains measurements related to Web forms declared in the load-testing script. The Web form measurement group provides response time measurements and throughput rates for form submissions with the POST, GET, and HEAD methods. For each form declared in the test script, a measurement group is created; the name of the form is used as the key to the measurement group created.
